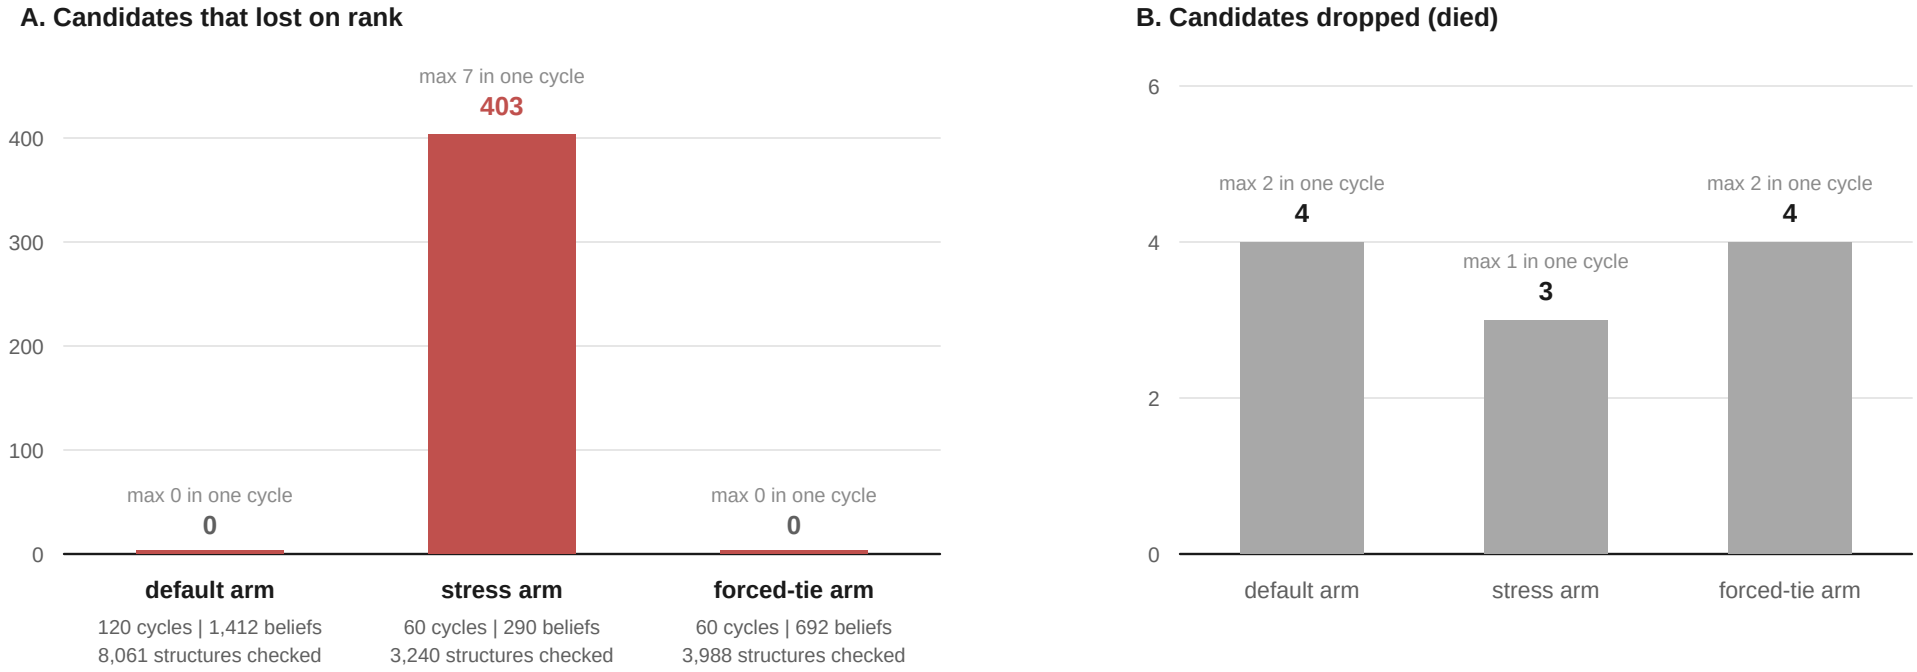
The selection check could only fail where the contest was decided

Candidates dropped and candidates that lost on rank, per arm, with what each arm checked.



In the default and forced-tie arms no candidate ever lost on rank, so the selection test could not have failed there.

The stress arm carries the non-vacuity argument: the cap bound, and 403 candidates lost on it.

The forced-tie arm additionally made 479 stores carry a tied timestamp window, and the observer still reproduced the engine's choice.
